ATMOSPHERIC RECOVERY LITIGATION AROUND THE WORLD:
GAINING NATURAL RESOURCE DAMAGES AGAINST CARBON MAJORS TO FUND A
SKY CLEANUP FOR CLIMATE RESTORATION

In this planetary climate emergency, the level of our ambition must match the scale of the threat.

I. INTRODUCTION

Stabilizing the planet’s climate system requires a full transition off of carbon intensive fossil fuels by at least mid-century and perhaps much sooner. But, as ambitious as that is, decarbonization alone is not sufficient. The global mean temperature rise of almost one degree Centigrade to date is the result of excess carbon emissions already flooding the atmosphere, due to roughly 150 years of industrial-scale greenhouse gas emissions. Scientists emphasize the importance of drawing down and sequestering 150 gigatons of “legacy” carbon -- in essence, accomplishing a cleanup of the sky. This chapter presents a meta-strategy for jumpstarting such a drawdown effort across the globe by creating

1 Mary Christina Wood, Philip H. Knight Professor, University of Oregon School of Law. This chapter is part of a larger work, Atmospheric Recovery Litigation Around the World: Funding Landscape Carbon Sequestration Through Suits Against the Fossil Fuel Industry for Climate Natural Resource Damages. Excellent research assistance and analysis was provided by Callan Barrett and Zachary Griffith, Research Fellows, Global Environmental Democracy Project, and Charles W. Woodward IV, Research Associate, University of Oregon School of Law Environmental and Natural Resources Law Center. Due to space constraints, this chapter omits multiple subsequent internal citations to discussed cases. For further reference and authorities, see Mary Christina Wood & Dan Galpern, Atmospheric Recovery Litigation: Making the Fossil Fuel Industry Pay to Restore a Viable Climate System, 45 ENVTL. L. 259 (2015); Michael C. Blumm & Mary Christina Wood, “No Ordinary Lawsuit”: Climate Change, Due Process, and the Public Trust Doctrine, 67 AM. U. L. REV. 1 (2017); Katrina Fischer Kuh, Judicial Climate Engagement, 46 ECOLOGY L. Q. (2019).

a funding mechanism achieved through atmospheric natural resource damage litigation, described below.

Scientists have developed a suite of methods to expand Nature’s own mechanisms of carbon sequestration through restoring degraded ecosystems. In 2017, a seminal scientific paper announced the potential to remove vast amounts of CO$_2$ through Natural Climate Solutions (NCS). NCS methods to draw down and absorb carbon in the soil include: 1) reforestation; 2) conservation agricultural practices (such as no-till, non-chemical, cover crop techniques and use of weathered rock as soil amendment); 3) mangrove and wetlands restoration; and 4) regenerative grazing methods. A global atmospheric cleanup using NCS requires a spectacular “scaling up” of the present effort, which consists largely of scattered projects providing pilot experience. Scientists have mapped many areas of the globe to depict carbon sequestration potential, so sovereigns can plan and execute NCS drawdown programs across their jurisdictions. While some analysts have noted ongoing uncertainty about the capacity of NCS to achieve the necessary global sequestration, much of the criticism reflects the reality that global projections are by their very nature abstract and disconnected from on-the-ground dynamics that vary markedly between regions. Customizing the NCS effort to the regional level enables teams to better assess actual sequestration potential and create tangible mechanisms to overcome land use impediments, maximize opportunity, promote accountability, and achieve permanence. Deploying these projects would engage farmers, foresters, ranchers, and indigenous communities in restoration, thereby stimulating local economies and potentially boosting community

3 Bronson W. Griscom et al., Natural Climate Solutions, 114 PROC. NAT’L ACAD. OF SCI. 11645 (2017).
adaptation efforts through achieving co-benefits such as enhanced food supply, flood mitigation, and water filtration. The ecosystem restoration that lies at the heart of NCS not only stands essential to climate system recovery, but also remains vital in responding to the global biodiversity crisis.\(^7\)

The magnitude of necessary ecosystem restoration through NCS is daunting, requiring the recruitment of nearly all available and suitable land across the world.\(^8\) This requires massive funding. In a functional political world, national leaders around the globe would convene to create an organized and funded framework for global carbon drawdown. But in a present leadership vacuum, those corporations most responsible for creating this crisis -- fossil fuel companies -- have yet to pay a dime for cleaning up the atmosphere.

This chapter suggests a global campaign of Atmospheric Recovery Litigation (ARL) to hold fossil fuel companies and other large emitters liable for atmospheric natural resource damages (NRDs) to fund projects sequestering carbon in the soil. The legal framework looks to the same principle that holds companies responsible for cleaning up marine oil spills – the public trust doctrine, described below. Natural resource damage actions yield awards that must be used to fund restoration of the harmed resource. While the U.S. federal government (under President Trump) is not presently inclined to lead a cleanup effort for the atmosphere, other sovereigns – states, tribes, counties, and foreign nations - are immediately positioned to do so. By setting forth a unifying liability framework, this chapter aims to catalyze a planetary effort that is uniquely localized, yet global in resolve. The ARL strategy is designed to parallel and compliment the decentralized litigation strategy known as Atmospheric Trust Litigation (ATL), described more fully below, currently proceeding apace to force the other climate imperative, decarbonization. Of course, by depleting the assets of “carbon majors,” ARL litigation would secondarily stimulate a wind-down of the fossil fuel industry, forcing a transition

---

\(^8\) See Griscom, *supra* note 3, at 11648.
to clean renewable energy and contributing to the decarbonization side of the climate imperative as well.

The Atmospheric Recovery Litigation contemplated in this chapter uses damages remedies (namely monetary awards) to a mitigation end – cleaning up the excess atmospheric carbon dioxide that is fueling climate disruption. As a strategy aimed to restore the climate system through drawdown, it seeks to prevent further loss and damage to society as a whole. By seeking compensation for direct damage to the atmosphere itself, these envisioned cases veer dramatically from cases seeking traditional damages for climate harm, and it is important to understand the distinction in order to assess litigation priorities in the field as a whole. The unavoidable fact is, there is simply not enough money in the world to pay for all of the harm unleashed by the fossil fuel industry. Thus, choices must be made, either directly or by default, as to which forms of damage will be funded through strategic litigation. At least six categories of climate harm are manifest world-wide: 1) human death and injury; 2) property loss; 3) economic loss; 4) community relocation expense; 5) community adaptation expense; and 6) atmospheric damage and collateral ecological injury. Compensating for losses in the first five categories, though unquestionably compelling in human terms, achieves nothing in terms of climate system recovery. Moreover, all five categories of damage will only worsen as the climate system spins out of control, leading to what scientists warn will be a largely “uninhabitable” planet. Atmospheric NRDs are geared not towards compensating human loss or financing adaptation, but towards actually cleaning up legacy excess carbon before irrevocable climate thresholds make it impossible to regain climate stability. Moreover, these lawsuits, as envisioned, will not seek natural

10 Further, because ARL lawsuits have the singular purpose of cleaning up the atmosphere of historic excess carbon dioxide, it is important to make clear that NRDs gained through these lawsuits may not be used to “offset” further carbon dioxide pollution. “Offsets” are controversial regulatory tools used in the realm of mitigation policy to legalize continued greenhouse gas pollution as long as the polluter buys some sort of carbon sequestration project (such as forest conservation) to “offset” that pollution. The same sequestration projects can be used either as offsets or measures or to clean up the sky, but it is vital to differentiate the two. Offset programs remain fatally misguided, because they simply legalize continued pollution without making any dent in the legacy pollution that continues to destabilize the climate system. Moreover,
resource damages for harm to corollary natural assets such as species, waterways, coastlines, oceans, and forests, because those resources cannot recover anyway until society addresses the underlying pollution syndrome causing such ecological upheaval.

In contrast to the contemplated ARL suits, the climate liability cases already progressing through the courts seek monetary awards against the fossil fuel industry for adaptation costs. These suits, now numbering over a dozen, have been filed by cities, counties, and one state against large corporate producers of fossil fuels, in what amounts to a second wave of climate lawsuits against the fossil fuel industry. The first wave primarily asserted federal common law nuisance claims, an avenue that was rejected by the U.S. Supreme Court in *American Electric Power (AEP) v. Connecticut*, on grounds that the federal Clean Air Act displaced such claims. The first-generation cases ended without relief, either in the form of injunctive remedies or damages.

The second-generation cases were initiated in 2017 against fossil fuel producers. They seek “disgorgement of profits,” or damages in unstated amounts, from the fossil fuel defendants to fund various municipal adaptation measures, such as replacement of infrastructure and construction of sea walls to hold back sea level rise. Carefully crafted to avoid the *AEP* displacement analysis that defeated the first-generation suits, these cases assert state (not federal) common law claims. All have a centerpiece public nuisance claim, and several present additional claims sounding in product liability and negligence. They cast a broad moral indictment of the fossil fuel industry by presenting jaw-dropping factual characterizations of what the companies knew would be the damage likely set in motion by their continued fossil fuel production. Nevertheless, two federal district courts dismissed offsets can monopolize key lands capable of sequestering carbon dioxide, thus competing with the sky cleanup. For discussion, see Christa M. Anderson *et. al, Natural Climate Solutions are Not Enough*, 363 Sci. 933, 933-934 (2019). The ARL strategy presented in this chapter represents a damages action that is completely independent of any offset policies.

12 *See, e.g.,* X’s Compl. at ¶ 186, County of San Mateo v. Chevron *et al.*, 294 F. Supp. 3d 934 (2018).

such cases on grounds of displacement and political question.\textsuperscript{14} As Katrina Kuh observes in her summary of the field, “So far, the second-generation common law nuisance suits are struggling, as their predecessors did, to convince courts to open their doors to the merits of their claims.”\textsuperscript{15} Recently, however, three appellate courts have found that those cases could move forward in state (rather than federal) court,\textsuperscript{16} dismantling a significant procedural hurdle for the plaintiffs.

The atmospheric natural resource damage action presented in this chapter remains fundamentally different in purpose from these second-generation climate suits, though both seek monetary damages against the same fossil fuel defendants. While the second-generation climate suits have a logical and laudable aim of compensating sovereigns for the costs of responding to climate disruption, this purpose nevertheless carries two drawbacks. First, it conjures a fundamental equity problem. Climate harms now pummel every corner of the world, saddling virtually all communities with soaring costs. The fossil fuel industry -- even despite its vast holdings -- will not be able to pay for even a fraction of the damage it has set in motion across the globe through its polluting products. If these American lawsuits win, they will drain the bank for the benefit of a few municipal litigants who positioned themselves first in line in the court system, leaving the great bulk of communities with no compensation. Second, the remedy does nothing to solve the climate crisis, because it does not fund methods to clean up the atmosphere. Until excess carbon is removed from the atmosphere (along with full decarbonization), the climate emergency will continue to intensify until it brings universal chaos and community collapse world-wide. Any conceivable adaptation measures will be for naught in a scenario of runaway heating.

\textsuperscript{14} See City of New York v. BP, 325 F. Supp. 3d 466, 471-75 (S.D.N.Y. 2018); City of Oakland v. BP, 325 F. Supp. 3d 1017, 1024-28 (N.D. Cal. 2018). For subsequent treatment of these issues, see supra note 16.

\textsuperscript{15} Kuh, supra note 1, at 11.

\textsuperscript{16} City of Oakland v. BP, 960 F.3d 570 (9th Cir. 2020); County of San Mateo v. Chevron Corp., 960 F.3d 586 (9th Cir. 2020); Board of County Commissioners of Boulder County v. Suncor Energy, No. 19-1330, 2020 WL 3777996 (10th Cir. July 7, 2020); Mayor of Baltimore v. BP P.L.C., 952 F.3d 452 (4th Cir. 2020).
Atmospheric NRD suits seek to restore the climate system by cleaning up excess carbon dioxide in the sky. As explained below, nearly every sovereign is positioned to sue for clean-up costs to fund drawdown projects in its jurisdiction. While any one sovereign can achieve only a fractional share of the total sky cleanup, virtually every successful project theoretically contributes to the overall planetary cleanup goal. Thus, a win for any NRD suit may represent a win for all jurisdictions across the globe, in contrast to the second-generation climate adaptation lawsuits, which allow for a few winners at best and leave the rest behind. Nevertheless, such suits have set important cornerstones of sky cleanup by amassing crucial evidence of industry culpability and crafting legal approaches to industry liability. The remainder of this chapter describes the similar, though differently purposed, Atmospheric Recovery Litigation.

II. THE PUBLIC TRUST PRINCIPLE IN CLIMATE LITIGATION

Harnessing a damages remedy to achieve a mitigation goal (climate restoration), ARL fits hand in hand with another litigation campaign, Atmospheric Trust Litigation (ATL), aiming to achieve decarbonization. Together, the ATL and ARL campaigns represent converging litigation addressing both sides of the climate mitigation imperative: decarbonization and drawdown. Both campaigns rest on the venerable public trust principle, which obligates and empowers government to protect and restore crucial ecological assets such as the atmosphere.

The public trust principle is fundamental and ancient, reaching to far greater depths than any statute. Manifest in many countries throughout the world, it designates governments as trustees of public resources, including the waters, shorelines, fisheries, wildlife, and, by logic, air and atmosphere. As trustee, government must protect this vital ecological endowment for the continued survival and

---

17 Regional atmospheric recovery plans can help guide courts in ensuring that a particular sovereign does not recover more that its rough proportionate share of damages for the sky cleanup.

18 For discussion, see Gerald Torres & Nathan Bellinger, The Public Trust: The Law’s DNA, 4 WAKE FOREST J L & POL’y 281 (2014).
benefit of future generations. Government may not irrevocably convey these natural resources to private parties or allow their substantial impairment. Such obligations trace back to public rights announced in Roman law and are repeatedly recognized by modern courts in nations such as India, Pakistan, South Africa, Colombia, Canada, the Philippines, and elsewhere.¹⁹ As several decisions have now elaborated, the public trust emanates from the “inherent and indefeasible” rights retained by the citizens when entering into a social compact forming government.²⁰ With constitutional force, the trust operates both as a restraint on government, disallowing substantial impairment to trust resources, and an affirmative obligation to protect those resources.²¹

The ATL campaign, spearheaded by the non-profit organization Our Children’s Trust, invokes the public trust in multiple suits brought on behalf of youth against their governments and seeks judicial remedies requiring agencies to accomplish necessary greenhouse gas emissions reduction. While many early cases failed due to the sheer reluctance of courts to involve themselves in matters of climate crisis, a notable state case, Foster v. Wash. Dep’t of Ecology, explicitly found a public trust obligation constitutionally compelling government to restore a healthy climate system.²² In that case, Judge Hollis Hill declared: “This is not a situation that these children can wait on.”²³ In 2015, attorneys filed a federal case, Juliana v. United States, on behalf of 21 youth against the U.S. federal government. In a landmark ruling handed down in 2016, the U.S. District Court of Oregon found a federal public trust doctrine enforceable though the constitution’s due process clause. Judge Ann Aiken declared that the federal government must protect a “climate system capable of sustaining

¹⁹ See Michael C. Blumm & Mary Christina Wood, The Public Trust Doctrine in Environmental and Natural Resources Law 3d, Chapters 11, 12 (Carolina Academic Press 2020) (compiling materials in the U.S. and other nations). Cases that impose sovereign obligations to protect future generations are categorized broadly as public trust cases even if they lack explicit trust language. Id.

²³ Id. at 20.
human life.” On early appeal however, in January, 2020, a two-judge majority of a Ninth Circuit panel overturned the district court’s decision, even while emphatically acknowledging the severity of climate emergency and going so far as to conjure the famous song, “‘Eve of Destruction.’” While Judges Anthony Hurwitz and Mary Marguia did not refute the constitutional rights of plaintiffs, they nevertheless found that any form of relief was beyond the capacity of the courts to grant. In a bitter dissent, the third judge on the panel, Judge Josephine Staton stated,

It is as if an asteroid were barreling toward Earth and the government decided to shut down our only defenses. Seeking to quash this suit, the government bluntly insists that it has the absolute and unreviewable power to destroy the Nation. My colleagues throw up their hands, concluding that this case presents nothing fit for the Judiciary. . . . [D]etermining when a court must step in to protect fundamental rights is not an exact science. In this case, my colleagues say that time is “never”; I say it is now.

The youth plaintiffs filed a petition for en banc review before the full Ninth Circuit, and the petition remains undecided as of this publication. While notable cases in other countries have imposed climate obligations on their governments, the U.S. saga so far reflects an extraordinary reluctance of American courts to enter the climate realm, described by Professor Doug Kysar and James Weaver as “judicial nihilism.” As they observe, “[d]enying [their] own expansive power, [courts have] cowered before catastrophe.”

The bedrock public trust principle asserted in the ATL cases likewise grounds the atmospheric natural resource damage actions contemplated by this chapter, but government is in a different posture

24 Juliana v. United States, 217 F. Supp. 3d 1224, 1250 (D. Or. 2016), reversed, 947 F.3d 1159 (9th Cir. 2020), petition for en banc review pending.

27 Id. at 1175, 1191.
in Atmospheric Recovery Litigation (ARL): government trustees are plaintiffs, not defendants. Sovereign co-trustees anywhere in the world – national governments, states and their political subdivisions, and indigenous sovereigns – are positioned to seek natural resource damages from fossil fuel industry defendants to fund cleanup of the atmosphere. Traditionally, polluters remain liable for natural resource damages to public trust assets. Sovereign trustees are obligated to seek recovery of such natural resource damages and apply them towards restoration of the resource. Although the scale of ecological recovery needed to stabilize the climate system is unprecedented, nevertheless the basic legal paradigm is no different than the principle’s regular application to more discrete contexts, such as an oil spill in marine waters.

III. ANALOGOUS LITIGATION HOLDING CORPORATIONS LIABLE FOR POLLUTION

In the United States, natural resource damage actions (not involving climate harm) are characteristically brought pursuant to statutes expressly allowing recovery of restoration costs resulting from the release of “hazardous substances” to the environment, or oil releases into waterways. Because there is as yet no federal law expressly providing atmospheric NRDs for damage from fossil fuel pollution, the Atmospheric Recovery Litigation approach must assemble common law principles (or general statutory provisions) to create a liability framework. This chapter suggests the public trust as a basis for NRD claims immediately available to government trustees. In constructing a liability framework, it will be useful to draw principles from three analogous areas of litigation in which sovereign or municipal plaintiffs have sued major producers or emitters under common law for

environmental damage. This chapter classifies all three areas as natural resource damage litigation because the cases all manifest the fundamental elements of an NRD action: a suit by a government trustee against a responsible party seeking money damages to cleanup a contaminated public resource which the trustee has the responsibility to restore. Virtually all of the complaints in the cases discussed below show those crucial markers of NRD litigation, and most (though not all) expressly assert the state’s role as trustee. These cases, advancing in both federal and state courts, reveal both opportunities and pitfalls for atmospheric NRD litigation. Summarized briefly here, their principles are discussed in more detail below.

A. MTBE LAWSUITS

One category of cases involves suits by municipal and state governments against major gasoline producers for groundwater contamination resulting from the chemical MTBE, used as an additive by petroleum companies decades ago to reduce octane levels in gasoline. Due to its chemical properties, spilled MTBE spreads easily into groundwater supplies. These cases form a highly instructive body of caselaw because they represent, in effect, natural resource damage actions without being so explicitly named. Several have met with remarkable success.

In New Hampshire, a jury held ExxonMobil liable for $236 million to fund groundwater cleanup. In another case, the City of New York won a $104 million judgment against ExxonMobil for groundwater contamination. Beyond court awards, plaintiff attorneys have gained huge settlements against producer corporations for MTBE contamination. While initial lawsuits did not

---

32 Some of the cases examined in this section also assert statutory claims, but those are not discussed in this chapter.
expressly assert the sovereigns’ public trust authority, two later suits do. The MTBE body of caselaw remains highly complex and is still evolving. While these cases use a variety of liability theories sounding in tort, they signal a willingness of many courts to hold producers responsible for contamination of a vital public resource.

B. PCB SUITS

At least fifteen lawsuits have been brought by government entities against Monsanto Corporation for ecological harm resulting from its manufacture of PCBs, highly toxic substances contaminating waters, sediments, fish, wildlife, and other natural resources. These suits generally seek damages to fund cleanup. Like the MTBE suits, these are predicated on liability attaching to the producer of the toxin (here, Monsanto). The claims range widely from general statutory claims to state common law claims such as those relating to public nuisance, negligence, trespass, defective products, and others. Like the MTBE suits, these are generally not called natural resource damage recovery actions, but the public trust frame has provided prominent grounding for some of the lawsuits. Complaints filed by the states of Oregon, Washington, and Ohio, for example, expressly assert public trust authority to sue polluters and recover damages to state public trust resources.

This vast and quickly evolving field has produced several early procedural victories. In Washington, the federal district court rejected a motion to dismiss, allowing the City of Seattle’s public nuisance and nuisance claims to proceed. The court found that the claims were not time-barred under a state statute (as private claims would be), because they were carrying out the state’s public trust duty

37 Lawsuits have been filed by the states of Oregon, Washington, New Mexico, and Ohio, and local governments, including Seattle, Spokane, Portland (City and Port of Portland), Berkeley, Oakland, San Jose, Long Beach, San Diego (City and Port), and Westport.
39 Because the cases are moving quickly through the court system, this chapter does not present a comprehensive summary.
to protect waters.\textsuperscript{41} In Oregon, where the State framed the lawsuit predominantly as one to recover damages to clean up public trust assets, the court rejected defendant’s motion to dismiss in part, allowing claims for public nuisance and trespass to public trust resources to proceed.\textsuperscript{42} In Ohio, a court allowed several claims, including the public trust claim, to proceed.\textsuperscript{43} Motions to dismiss have failed in several other cases as well.\textsuperscript{44}

\textbf{C. PFAS LITIGATION}

An emerging area of litigation arises over the nearly ubiquitous contamination caused by per- and polyfluoroalkyl substances (PFAS), known as “forever chemicals” because they persist in the environment indefinitely, contaminating surface waters, ground water, soils and fish and wildlife. PFAS are toxic chemicals found in firefighting foams, stain-and-water-resistant fabrics, and Teflon products that bioaccumulate and cause serious health effects.\textsuperscript{45} While many suits have been filed against manufacturers (including Dupont Corporation) for private injury,\textsuperscript{46} a second wave of litigation seeks natural resource damages to clean up the contamination. In 2015, the State of Vermont filed suit against several PFAS manufacturers, invoking both its \textit{parens patriae} and public trust capacity to sue. The complaint asserted, in its first cause of action, a stand-alone claim for “Natural Resource Damages and Restoration” grounded in the state’s common law public trust doctrine, stating, “The State, as trustee, may bring a cause of action to recover damages to and restoration of natural resources

\textsuperscript{41} Id. at 1104-05.
\textsuperscript{45} Pl.’s Compl. at ¶ 10, 185, Vermont v. 3M Co., No. 2:19-cv-00134 (Vt. Super. Ct. 2020).
\textsuperscript{46} For discussion of the manufacturing process that causes this toxic contamination, and the lawyer who has battled the industry responsible for it, see ROBERT BILOTT, EXPOSURE: POISONED WATER, CORPORATE GREED, AND ONE LAWYER'S TWENTY-YEAR BATTLE AGAINST DUPTON (2019); Dark Waters (Killer Films 2019).
held in trust by the State.”  The complaint asserted strict, joint, and several liability for such natural resource damages. Other common law claims set forth liability for defective product, failure to warn, negligence, public nuisance, trespass, and private nuisance.

In May, 2020, the Vermont Superior Court denied the defendants’ motion to dismiss the case, allowing most of the State’s claims to go forward. Most notably, the court affirmed the natural resources damage claim and also underscored the state’s public trustee role in many of the tort-based claims, as discussed in further detail below. While it may be premature to draw firm conclusions from this nascent field of PFAS litigation, the Vermont trial court’s decision indicates early synchrony with the trending approach apparent in the PCB and MTBE litigation holding manufacturers liable for ecological cleanup costs. The significance of this case is that, by endorsing an express “natural resource damage” cause of action, it solidifies the standing of sovereigns seeking NRDs for restoring damaged ecological resources.

A similar case filed by the state of New Hampshire includes a self-standing public trust claim for restoration costs and is moving forward. Chemical manufacturer defendants in that case did not move to dismiss the public trust claim, though they succeeded in gaining dismissal of various other claims including a trespass claim premised in part on public trust ownership of resources.

IV. THE PUBLIC TRUST ATMOSPHERIC RECOVERY LITIGATION FRAMEWORK

The atmospheric recovery lawsuit presents a common-law analogue to a lawsuit seeking recovery of natural resource damages in the wake of an oil spill in waters. The discussion below does not purport to resolve or even identify every procedural impediment that may arise in such an effort, but rather frames an approach. Litigators must navigate specific rules and doctrines applicable in their jurisdiction.

A. THE ATMOSPHERE AS A RES

It is only logical that atmospheric pollution can be the subject of a common law NRD claim. Air has been considered a public asset since Roman times and remains a resource crucial to the survival of life on Earth. Roman law classified air—along with water, wildlife and the sea—as res communes, and many courts have emphasized Roman law as the origin of the public property rights underlying the trust principle. In Georgia v. Tennessee Copper Co., the Supreme Court essentially proclaimed air as the people’s sovereign property, declaring: “[T]he state has an interest independent of and behind the titles of its citizens, in all the earth and air within its domain.”

49 Geer v. Connecticut, 161 U.S. 519, 525 (1896) (citing Roman law’s public resources as including “the air, the water which runs in the rivers, the sea and its shores [and] wild animals.”).
50 Id. at 523.
While courts historically characterized the scope of the trust as encompassing navigable waters and wildlife (likely focusing on those because they were frequently litigated), modern courts have made clear the trust’s application to a broader array of natural resources crucial to society.\textsuperscript{52} Courts emphasize that this doctrine is not “fixed or static,” but instead “‘molded and extended to meet changing conditions and needs of the public it was created to benefit.’”\textsuperscript{53} Indeed, the Vermont Superior Court in \textit{Vermont v. 3M} cited that rationale in holding that groundwater, fish and wildlife are part of the public trust, squarely rejecting the defendants’ argument that the doctrine is limited to navigable waters that dominated the old cases.\textsuperscript{54} The court also made clear that the public purposes protected by the trust constantly evolve and include modern interests such as public health and drinking water protection.\textsuperscript{55}

These same rationales call for including the air and atmosphere in the realm of public trust assets, and recognizing climate stability (certainly as important to public welfare as drinking water is) as a public trust interest. Indeed, several courts and commentators now include air and atmosphere within the ambit of public trust protection, and numerous constitutions and statutes in the United States do the same.\textsuperscript{56} Judges in two notable ATL climate cases have extended public trust to protection to the atmosphere and climate system. As the court in \textit{Foster v. Dep’t of Ecology} recognized, the atmosphere is inextricably connected to submerged lands, which are traditionally and unequivocally subject to the trust (“[t]o argue that GHG emissions do not affect navigable waters is nonsensical. . .”).\textsuperscript{57} The \textit{Juliana} court adopted the

\textsuperscript{52} See Kanner, \textit{supra} note 30, at 82.
\textsuperscript{53} Matthews v. Bay Head Improvement Ass’n, 471 A.2d 355, 365 (N.J. 1984) (citation omitted).
\textsuperscript{55} \textit{Id.} (“Public health, as is clear from the current pandemic, is unquestionably of as much-if not more-public concern to the people of Vermont as is navigation.”).
same reasoning when it held that atmospheric protection remains crucial to sustaining ocean and shoreline trust resources.58

But despite the essential role of air and atmosphere, scant litigation has sought to recover NRDs for air pollution. The obvious reason is because air pollution (unlike an oil spill) quickly and imperceptivity dissipates from the immediate area of impact, obviating a local clean-up.59 Atmospheric GHG pollution, however, presents a different matter. The atmosphere accumulates GHGs, showing increasing concentrations that are precisely monitored.60 The excess of atmospheric CO₂ (beyond pre-Industrial levels) requiring drawdown is about 150 GtC.61 Carbon dioxide pollution to the global atmosphere is measurable (though not visible), just as oil spilled in marine waters is measurable (but visible).

B. THE SOVEREIGN CO-TRUSTEES

Because the atmosphere is a global resource, there is not one trustee, but rather co-trustees bearing responsibility to protect the ecological asset. All national, subnational, state, and tribal sovereigns effectively share this non-divisible global asset, so any trustee, in theory, has standing to sue for damage to the atmosphere.62 The United Nations Framework Convention on Climate Change (UNFCC)—entered into in 1992 by most countries of the world—recognizes nations as co-trustees by stating a common duty to protect the atmosphere for future generations and to prevent “dangerous anthropogenic interference with the climate system.”63 Subnational sovereigns—such as states in the United States—are recognized as public trustees of ecological assets. American Indian tribes are also recognized as trustees

61 See supra note 2.
62 For discussion of sovereign trustees, see Wood & Galpern, supra note 1, at 128-30.
of shared natural resources, expressly designated as such under environmental statutes.\textsuperscript{64}

C. THE CLIMATE LIABLE PARTIES (CLPs)

Large classes of industrial actors have profited enormously from producing fossil fuels even in spite of longstanding knowledge that doing so imperils the planet’s climate system and human survival. Because the major corporate fossil fuel producers hold immense assets and bear culpability for the climate crisis, Atmospheric Recovery Litigation targets them to pay for cleanup of the atmosphere.\textsuperscript{65} The climate adaptation cases already assert producer liability, similar to the focus of the PCB, MTBE, and PFAS cases. All four contexts require courts to push liability further up the chain of commerce from the actual parties that emit or dispose of the dangerous substances. Not surprisingly, the task of identifying liable parties intersects directly with causation issues (explored below).

A groundbreaking report released in 2014 blazed a trail leading to producer liability in the climate context.\textsuperscript{66} The research team used production and supply records to correlate GHG emissions to specific companies (and predecessors) producing oil, gas, coal, and cement, dating back to the beginning of the Industrial Revolution. The report found that nearly two-thirds of GHG emissions generated since the beginning of the industrial age could be attributed to just 90 companies (dubbed the Carbon Majors).\textsuperscript{67} This research has provided the platform for the ongoing climate adaptation liability suits against major

\textsuperscript{64} For discussion, see Mary Christina Wood & Zach Welcker, Tribes as Trustees Again (Part I), The Emerging Tribal Role in the Conservation Trust Movement, 32 HARV. ENVTL. L. REV. 373 (2008). Indigenous rights vary between nations, but where legal recognition of sovereignty exists, indigenous governments arguably have a strong claim to sue for restoration as primary trustees or as co-trustees of resources. Recent legal developments seemingly indicate a willingness to recognize such rights in countries outside of the United States. In New Zealand, the legislature accorded indigenous representatives a co-management role in restoring the Whanganui river system. And in Colombia, a court emphatically affirmed the rights of indigenous people to demand, and participate in, restoration of the severely degraded Atrato River watershed. For discussion of both, see M. Kauffman & Pamela L. Martin, How Courts Are Developing River Rights Jurisprudence: Comparing Guardianship in New Zealand, Colombia, and India, 20 Vermont J. Envtl. L. 261 (2019).

\textsuperscript{65} Other categories of emitters, such as cement factories, are also liable, in theory, for emissions. This chapter focuses on the fossil fuel companies as a proxy for carbon majors more broadly.

\textsuperscript{67} Suzanne Goldenberg, Just 90 Companies Caused Two-Thirds of Man-Made Global Warming Emissions, THE GUARDIAN (Nov. 20, 2013).
producers such as Exxon, Chevron, BP, Shell, and others.

Producer liability is fast gaining ground as a result of all three categories of analogous litigation described above as well as the second-generation climate liability suits. Though the climate suits have not yet gained a liability judgment against the carbon majors, neither has there been a decision finally absolving them of liability. Two notable dismissals so far (by federal Judge Alsup of California and federal Judge Keenan of New York) focused more on separation of powers issues than producer liability, although J. Alsup (reversed on appeal) signaled discomfort with the “breathtaking” scope of plaintiffs’ theory, which would “reach the sale of fossil fuels anywhere in the world, including all past and otherwise lawful sales, where the seller knew that the combustion of fossil fuels contributed to the phenomenon of global warming.” A recent ruling by Rhode Island federal district Judge William Smith, remanding a suit back to state court, underscored the logic of holding fossil fuel producers liable for climate damage and summarized the case in this way:

Climate change is expensive, and the State wants help paying for it. Specifically from Defendants in this case, who together have extracted, advertised, and sold a substantial percentage of the fossil fuels burned globally since the 1960s. This activity has released an immense amount of greenhouse gas into the Earth’s atmosphere, changing its climate and leading to all kinds of displacement, death (extinctions, even), and destruction. What is more, Defendants understood the consequences of their activity decades ago, when transitioning from fossil fuels to renewable sources of energy would have saved a world of trouble. But instead of sounding the alarm, Defendants went out of their way to becloud the emerging scientific consensus and further delay changes — however existentially necessary — that would in any way interfere with their multi-billion-dollar profits. All while quietly readying their capital for the coming fallout.69

Courts may be more comfortable holding fossil fuel companies liable for naturalresource damages than open-ended damages for adaptation and infrastructure repair.70

Natural resource damage awards against fossil fuel companies have long-standing precedent

70 See State v. 3M, No. 547-6-19 Cncv, 8 (Vt. Super. Ct. May 2020) (noting caselaw allowing state to recover damages for public nuisance claim only when funds used to actually abate the nuisance).
as a result of numerous oil spills that are all too familiar to courts and society as a whole. But also, the equity concerns noted at the outset of this chapter may undermine open-ended liability for funding adaptation infrastructure, as fossil fuel industry coffers can likely fund only a fraction of the deserving communities that need financial assistance to adapt. Natural resource damages hold the advantage of abating the underlying environmental problem (excess atmospheric carbon) causing global damage.\textsuperscript{71} They are closely analogous to the three categories of litigation involving toxic chemicals, now proceeding apace to hold producers liable.

At least eight of the notable PCB suits against Monsanto have survived motions to dismiss.\textsuperscript{72} In \textit{San Jose v. Monsanto}, a federal judge ruled that Monsanto may be liable for public nuisance when it failed to provide adequate instructions on how to dispose of PCBs properly.\textsuperscript{73} In \textit{Seattle v. Monsanto}, the court refused to grant defendant’s motion to dismiss, finding, “Seattle has sufficiently alleged that Monsanto produced and marketed certain toxic chemicals that now contaminate Seattle’s streets, drainage systems, and [waterways].”\textsuperscript{74} In \textit{Oregon v. Monsanto}, the court squarely rejected Monsanto’s position that a manufacturer could escape liability for trespass claims, stating, “Defendants cite no authority for the proposition that the general elements of trespass do not apply to a party whose relevant actions were in the context of manufacturing a product and/or placing that product into a stream of commerce.”\textsuperscript{75}

\textsuperscript{71} Some courts limit the available recovery of damages in public nuisance claims brought by public entities to damages that seek abatement of the nuisance. See US Masters Residential Prop. (USA) Fund v. N.J. Dep’t of Envtl. Prot., 239 N.J. 145 (2019). See also supra note 70. Under this approach, damages for adaptation costs may not be favored by courts.

\textsuperscript{73} \textit{City of San Jose}, 231 F. Supp. 3d at 364-65.

\textsuperscript{74} \textit{City of Seattle}, 237 F. Supp. 3d, at 1105.

\textsuperscript{75} \textit{Oregon}, No. 18CV00540, at 18.
Similarly, in the MTBE context, several (though not all) cases have established producer liability for environmental contamination. In the Second Circuit’s opinion in *In re MTBE Products Liability Litigation*, the court affirmed a jury’s finding that ExxonMobil was liable for groundwater contamination based on theories of trespass, public nuisance, negligence, and failure to warn.\(^\text{76}\) While Exxon argued that its actions as a “‘mere refiner and supplier’ of gasoline were ‘too remote from any actual spills or leaks,’” the court found Exxon liable as a manufacturer, refiner, supplier, or seller, because the corporation knew that the gasoline it sold would be spilled.\(^\text{77}\)

In *Vermont v. 3M*, a court denied motions to dismiss against multiple manufacturers of the PFAS chemicals, finding that several claims could go forward, including ones for natural resource damages, product design defect, public nuisance, private nuisance, and trespass to state-owned lands. While the plaintiff state argued manufacturers were liable for placing their products into the “stream of commerce,” the defendants argued against liability on the basis that they relinquished control over the chemicals once the products were sold. Rejecting the argument, the court cited MTBE litigation that holds manufacturers liable, indicating some cross-fertilization between these different areas of analogous litigation.\(^\text{78}\)

Notably, in the PCB, MTBE, and PFAS cases, a common thread is alleged producer knowledge regarding the effects of the product in question. Apart from whether such knowledge is a required element in a particular claim, it puts defendant manufacturers in a particularly unfavorable, bad-faith, light that may sway courts towards imposing liability. In this regard, the ongoing climate adaptation liability cases, by amassing years of discovery documents against the fossil fuel industry, provide a robust evidentiary platform that

\(^{\text{76}}\) *MTBE Prods. Liab. Litig.*, 725 F.3d 65, 91 (2nd Cir. 2013).

\(^{\text{77}}\) But see Commonwealth of Pennsylvania v. Exxon Mobil Corp., 2015 WL 4469247, 14-15 (S.D.N.Y. July 2015) (applying Pennsylvania law that limits public nuisance liability to those who owned or operated the sites where the release of hazardous substances occurred).

solidifies producer knowledge of the harmful effects of fossil fuel emissions on the climate system.\textsuperscript{79}

D. THE CLAIMS

The claims in an atmospheric NRD suit may be quite varied, and this discussion only generally maps the terrain. The driving concept is simply that responsible industry parties should pay for the carbon release in the sky, just as they would be forced to pay for cleaning up a spill of oil or toxins in a waterway. In the water pollution context, sovereign trustees readily invoke statutory authority (such as the Oil Pollution Act and CERCLA) to seek natural resource damages. There is no such obvious statutory scheme for cleaning up the sky,\textsuperscript{80} but common law claims and generic statutes exist as a basis for such litigation. CERCLA, in fact, was premised on the public trust doctrine’s fiduciary duty to seek damages from third parties to restore a polluted trust asset.\textsuperscript{81} Commentators have long urged government trustees to assert common law claims premised on the public trust and/or nuisance law to seek natural resource damages either in concert with statutory claims or independent of such claims.\textsuperscript{82}

The discussion below illuminates two possibilities. The first is a stand-alone public trust claim for natural resource damages. The second is a public nuisance and/or trespass claim seeking relief for interference with public trust property. This common law claim might be accompanied by other tort claims relevant to the situation (such as negligence, defective product, and manufacturer’s failure to warn). The three categories of relevant and analogous litigation highlighted above (the PCB, MTBE, and PFAS litigation) assert some or all of these common law claims in various cases.\textsuperscript{83} And of course,

\textsuperscript{80} While statutory NRD provisions characteristically include air as a trust asset, they do not extend to CO\textsubscript{2} pollution.
\textsuperscript{82} Id. at 10299; Kanner, supra note 30, at 58 (common law claims are “immediately available” to recover natural resource damages).
\textsuperscript{83} It is well beyond the scope of this chapter to provide comprehensive discussion of the claims in these three areas. Notably, this chapter does not delve into the procedural reasons why some claims have failed in particular cases. Instead it highlights the potential strength of those that have survived motions to dismiss.
while not discussed below, sovereigns may have generic statutes or may pass climate-specific legislation allowing recovery of atmospheric NRDs.

1. **PUBLIC TRUST CLAIM FOR NATURAL RESOURCE DAMAGES**

A straightforward public trust claim should support recovery of natural resource damages. Where third parties have harmed trust assets, the trustee has the affirmative duty to recoup monetary damages to restore such assets. The duty remains a classic obligation in the private sphere, and it is well-established in the sovereign context as well. In an extensive article on the subject, Allen Kanner asserts: “[U]nder the public trust doctrine, a state AG [attorney general] can sue, as trustee, for damages to natural resources that are held in the public trust.”

In his leading treatise on environmental law, Professor William Rodgers explains that the public trust “can be invoked offensively by the government as in a suit to collect damages to trust property.”

Another commentator observes that case law “clearly affirm[s] that a state, as trustee for certain natural resources, has the power to recover damages for injuries to these natural resources” and that the public trust doctrine “supplies the state with a cause of action in natural resource damage cases.” The public trust, where recognized, may provide a basis for atmospheric NRD actions outside of the U.S. as well.

American courts have established the authority to recover NRDs as a matter of both state and federal common law. In *State v. Gillette*, the Washington Court of Appeals ruled that the State Department of Fisheries was entitled to recover NRDs for loss of fisheries habitat even absent a statutory provision allowing recovery, explaining, “[T]he state, through the Department, has the fiduciary obligation of any trustee to seek damages for injury to the

---

84 See Kanner, supra note 30, at 59 (also suggesting *parens patriae* doctrine as basis for suits).
object of its trust.” 88 In *In Re Steuart Transportation Co.*, 89 a federal district court held that the federal government and the state of Virginia could recover under the public trust doctrine for the loss of migratory waterfowl resulting from an oil spill, absent any statutory basis. 90 In Maryland, a federal district court imposed common law (pre-statutory) liability for a tanker’s release of oil, stating, “[I]f the State is deemed to be the trustee of the waters, then, as trustee, the State must be empowered to bring suit to protect the corpus of the trust -- i.e., the waters -- for the beneficiaries of the trust -- i.e., the public.” 91 And in *State v. City of Bowling Green*, the Ohio Supreme Court found a municipality potentially liable under the PTD for a fish-kill caused by its negligent discharge of sewage, reasoning:

An action against those whose conduct damages or destroys [trust] property, which is a natural resource of the public, must be considered an essential part of a trust doctrine, the vitality of which must be extended to meet the changing societal needs. 92

In the PCB litigation, at least one state has invoked the PTD as a stand-alone cause of action against Monsanto. Ohio’s first cause of action asserted, “Ohio, in its capacity as trustee over its public natural resources, has suffered and continues to suffer monetary losses in amounts to be proven at trial.” 93 Monsanto filed a motion to dismiss claiming that the PTD could not form the basis of a stand-alone claim. Denying the motion and deferring the final decision for a later time, the court said, “The public trust doctrine, however, may yet prove to stand as its own cause of action as society's needs change.” 94

In MTBE litigation, the State of Rhode Island’s case against industry defendants included a stand-alone public trust claim asserting “[i]mpairment of [p]ublic [t]rust [n]atural [r]esources.” 95

90 Id. at 40.
94 Entry Denying Defendants’ Motion to Dismiss, *Ohio*, No. A 1801237, slip op. at 7 (Sept. 19, 2018).
While the claim was dismissed, the federal court seemingly did not question the state’s ability to assert such a claim but rather found that public trust law of the state had not yet been extended to groundwater.96 The court left open the possibility that the state could extend the PTD to include groundwater in the future through legislation or decisional law. Moreover, the court allowed other claims to go forward, including a trespass claim that was premised largely on the state’s *parens patriae* interest (closely related to the public trust) in its natural resources.97 In another MTBE case, the Supreme Court of New Hampshire clearly indicated the viability of a public trust claim (though the state plaintiff did not fashion one), in the context of groundwater contamination, stating:

The doctrine allows a state attorney general, as trustee, to bring a cause of action for damages to natural resources held in trust by the State. To bring a successful claim, the State must prove an unreasonable interference with the use and enjoyment of trust rights. . . . [T]he public trust doctrine is its own cause of action. . . .98

Of the second-generation climate cases, one brought by Rhode Island included a stand-alone public trust claim premised on the state’s constitution, asserting damages necessary to “restore injuries to public trust resources.”99 The requested relief, however, does not aim to restore climate stability but rather seemingly ties to infrastructure damages and restoration of localized natural resources. The case has been remanded from federal court back to state court with no disposition of the claim yet.100

And in recent PFAS litigation, a Vermont court allowed a stand-alone claim by the state for natural resource damages to fund the state’s cleanup.101 The complaint labelled the cause of action a

---

96 *Rhode Island*, 357 F. Supp. at 144.
97 *Id.* at 143-44.
98 *State v. Amerada Hess Corp.*, 161 N.H. 426, 431-32 (S. Ct. N. H. 2011). The complaint had asserted a property interest, as trustee, over “waters of the state, whether located above or below ground. . . .” to ground claims in both public nuisance and trespass. *Pl.’s Compl. at Par. 2, Count III, IV, New Hampshire v. Amerada Hess Corp.*, WL 22469979 (2003). *See also San Diego Unified Port District v. Monsanto Co.*, No. 15-cv-578, 2016 WL 5464551, at 11 (S.D. Cal. Sept. 28, 2016) (finding that a Port District could maintain action under public trust for "damages for the injury to and loss of use of natural resources deriving from the presence of PCBs in and around the Bay, including the cost of restoring those natural resources.") (internal quotation omitted).
100 *Chevron Corp.*, 393 F. Supp. 3d at 142.
“civil action for natural resource damages and restoration”102 (rather than entitling it a “public trust claim”), grounding it in the state’s duties as a public trustee. The complaint alleged strict, joint and several liability among the defendants. Rejecting the defendants’ motions to dismiss this claim, the court’s discussion focused primarily on recognizing the flexibility of the public trust to encompass resources such as groundwater and wildlife and extend beyond the traditional scope of the doctrine applicable to navigable waters. Notably too, the court cited Vermont law cautioning against dismissing claims “when the asserted theory of liability is novel or extreme.” Curiously, however, in the closing part of the opinion when addressing Dupont’s arguments, the court agreed with Dupont that the public trust doctrine does not present a self-standing, substantive cause of action, stating:

The doctrines [public trust and parens patriae] at issue give the State the right to assert the substantive claims raised in other counts of the complaint—such as nuisance or trespass—but they do not create new substantive claims. . . . The doctrines, however, properly underly the State’s other claims.

Thus, while the court squarely upheld a claim for natural resource damages, it seemingly distinguished such a claim from a stand-alone public trust claim, despite saying at the outset of its opinion, “The State's claim for ‘natural resources damage’ is a claim brought under the common law ‘public trust doctrine’ to protect surface waters, groundwater, and wildlife.”103 The court’s confusion reflects the novelty of a public trust claim to some courts (unlike other claims grounded in nuisance and trespass and design defect, for example). The court asked, “[W]hat would the elements of [a free standing public trust claim] be?” As pled in the complaint, the State never included an express “public trust claim,” opting instead to call it a claim for natural resource damages, and the court endorsed that framing at the outset of the opinion. The elements to this

102 Pl.’s Compl. at ¶ 10, Vermont v. 3M Co., No. 2:19-cv-00134 (“First Cause of Action: Civil Action for Natural Resource Damages and Restoration,” stating, at par. 228, “The State, as trustee, may bring a cause of action to recover damages to and restoration of natural resources held in trust by the state.”).
103 Vermont, No. 2:19-cv-00134, slip op. at 2. In a very confusing part of the opinion, the court indicated that, “to the extent that the State seeks to assert a freestanding cause of action in Count 1, the motion to dismiss that count is granted.” Id. at 14.
claim, asserted by the state, were that the defendants “unreasonably interfered with the use and enjoyment of public trust rights, and have injured the natural resources of the State of Vermont through [their] acts and omissions.”\(^{104}\) Accepting a common law claim for natural resource damages styled in this manner, the Vermont PFAS opinion suggests that it may important for state litigators to consider framing their claims as natural resource damage claims rather than “public trust claims” even though the matter is simply one of semantics. On the other hand, a recent decision in a case brought by New Hampshire against PFAS manufacturer 3M did not disparage a stand-alone public trust claim brought in that case, noting, “Defendants are not challenging the State’s ability generally to pursue remedies for the alleged contamination of its resources on behalf of the public as a public trustee or whether it has standing to maintain its other claims as *parens patriae*. Indeed, the State is pursuing a public trust doctrine claim in Count V of its complaint, which Defendants have not moved to dismiss.”\(^{105}\)

2. **NUISANCE, TRESPASS, AND OTHER COMMON LAW CLAIMS**

State tort law provides another set of possible claims. Notably, all three categories of analogous litigation (PCB, MTBE, and PFAS cases) assert state public nuisance claims, and many include trespass, negligence, and product liability claims as well. The public nuisance claims warrant special description. Generally speaking, the law of public nuisance casts a wide net, covering "an unreasonable interference with the rights common to the general public."\(^{106}\) Extending far beyond public property rights in ecology, nuisance claims can reach to matters of public health, safety, morals, and public peace, addressing even tobacco sales and opioid addiction.\(^{107}\) But invoked in the PCB, MTBE, and PFAS cases, the claim narrows to a clear public property interest in trust resources (such

\(^{104}\) Pl.’s Compl. at ¶ 230, *Vermont*, No. 2:19-cv-00134.

\(^{106}\) See Carlson, *supra* note 81 at 10299, 10302, n. 41 and accompanying text.

as groundwater in the MTBE cases, and a broader array of natural resources in the PCB and PFAS cases) and presents something of a hybrid public trust/public nuisance claim quite distinct from social nuisance claims – as the Vermont court said, the public trust (and parens patriae) “properly underly” other tort claims.\textsuperscript{108} Government lawyers may ground their cases in nuisance to present something recognizable and conventional to courts that may be unfamiliar with the public trust.

The PCB, MTBE, and PFAS litigation all show some notable success where hybrid public trust/public nuisance claims have been implicitly or explicitly tied to the sovereign’s trust duty to restore the natural resources damaged by the toxic pollution.\textsuperscript{109} An early victory resulted in \textit{Oregon v. Monsanto}, where the state asserted a \textit{per se} nuisance claim explicitly tied to its public trust responsibility, claiming, “The continuous presence of PCBs on lands and in rivers, waterways, and lakes that [the state] owns or holds in trust for the benefit of the public constitutes a \textit{per se} public nuisance.”\textsuperscript{110} Rejecting Monsanto’s motion to dismiss, the trial judge found not only a viable \textit{per se} nuisance claim (citing a state statute prohibiting the pollution of state waters), but also found all elements of a common law public nuisance claim satisfied.\textsuperscript{111} Likewise, in a PCB case brought by the City of Seattle, a federal district court judge rejected defendant’s motion to dismiss a public nuisance claim.\textsuperscript{112} Though the complaint failed to mention the public trust, the court framed Seattle’s claims in public trust terms, stating,

\begin{quote}
In this action to restore the purity of its waterways, Seattle acts in its sovereign capacity. . . . This authority derives from the state’s duty to hold all navigable waters within the state in trust for the public. . . . Harm to the environment from the continued production, marketing, and
\end{quote}

\textsuperscript{108} \textit{Vermont}, No. 2:19-cv-00134 at slip op. 14. Notably, the second-generation climate liability cases do not present this hybrid public trust/public nuisance claim, as they seek compensation for repairing or building infrastructure, not public trust property. The one exception is the State of Rhode Island case against carbon majors asserting one public trust claim but without specifically seeking NRDs to fund restoration. \textit{State v. Chevron Corp.}, 393 F. Supp. 3d 142 (D. R.I. 2019).

\textsuperscript{109} Some cases or claims have been dismissed or have received adverse rulings on other grounds not relevant to this discussion. This chapter does not contain an exhaustive review.

\textsuperscript{110} Pl.’s Compl. at 42, \textit{Oregon v. Monsanto Co.}, No. 18CV00540, (Or. Cir. Ct. Jan. 9, 2019).

\textsuperscript{111} \textit{Oregon}, No. 18CV00540, at 13-14.

\textsuperscript{112} \textit{City of Seattle v. Monsanto Co.}, 237 F. Supp. 3d 1096, 1107 (W. D. Wash. 2017).
routine use of PCBs was thus foreseeable to Monsanto, giving rise to a duty to avoid that harm.\textsuperscript{113}

In \textit{Washington v. Monsanto}, the State invoked its role as public trustee to frame its nuisance claims and remedy seeking cleanup costs for PCBs, stating: “The injury to public natural resources is especially injurious to the state in its proprietary and natural resource trustee capacities.”\textsuperscript{114} The case, removed to federal court and then remanded back to state court,\textsuperscript{115} has no dispositive orders yet, but should prove enlightening to lawyers considering atmospheric NRD litigation.

In the MTBE context, public nuisance and/or other common law claims (primarily negligence and product liability) have supported both large court awards and settlements. In a Rhode Island case brought by the state against MTBE producers, the court upheld the state’s public nuisance claim, declaring: “Widespread water pollution is indeed a quintessential public nuisance.”\textsuperscript{116} But because these claims are premised on state laws, results differ between states. A federal court dismissed a similar public nuisance claim brought by the State of Pennsylvania, because the law of that state limits liability to owners or operators of the site upon which the offending release occurs.\textsuperscript{117} Though the common law claims asserted in early MTBE cases usually failed to mention the public trust,\textsuperscript{118} their aim was decidedly a public trust objective of cleaning up public groundwater sources. The stunning success of some cases signals a willingness of many (though not all) courts to hold producers responsible for contamination of this vital public resource, and several other cases have produced multi-million dollar settlements out of court.\textsuperscript{119}

\textsuperscript{113} \textit{Id.} at 1104. The analysis involved questions of standing, statute of limitations, and causation.
\textsuperscript{118} See, e.g., \textit{MTBE Prods. Liab. Litig.}, 725 F.3d 65, 91 (2nd Cir. 2013) (listing tort causes of action on which plaintiff prevailed, including negligence, trespass, public nuisance, and failure to warn); but see n. 127 infra, discussing a pending MTBE case filed in Maryland using public trust to frame common law claims.
\textsuperscript{119} Brian J. Clark, \textit{Articles & Advisories: MTBE Litigation Update: South Tahoe and Beyond}, Buchanan Ingersoll & Rooney, PC (April 5, 2011). It is beyond the scope of this chapter to discuss in detail various impediments that have caused tort claims against producers to fail.
In the PFAS litigation, a Vermont court allowed the state to pursue a public nuisance claim where the state had alleged that the defendants placed their products into the stream of commerce with knowledge that they would escape and contaminate State natural resources and property (including soils, groundwater, surface waters, wildlife, and drinking water supplies), and thereby pose “’substantial risks to human health.’” The court made clear that “[i]f the State expended funds to clean up a nuisance, it may potentially recover for those expenditures.”

As to the trespass claims asserted in many of these cases, the results are varied, turning largely on how the court views the exclusivity requirement of trespass law. The Vermont PFAS court allowed a trespass claim to go forward with respect to property owned by the state, but precluded the state’s trespass claim as to groundwater. Despite the state’s role as trustee for such groundwater resources, the court found the state could not assert the “exclusive possession” needed to ground a trespass claim. A Superior Court in New Hampshire PFAS case agreed with the analysis and dismissed the trespass claim brought by the state against a manufacturer, stating, “The State’s complaint does not well fit the legal construct of trespass.” A federal judge handling multi-district MTBE litigation in Southern District of New York arrived at the same conclusion. In New Jersey, in two different cases in which the state asserted common law trespass claims to recover damages for cleaning up oil and other substances on privately owned land, one court rejected the claim based on the exclusivity factor, in reasoning upheld by an appellate court, but another lower court in New Jersey found that the public trust trumps the

121 Id.
122 Id. at 11-12 (“If the groundwater is held in trust for all the people of the State, and all may use it, it cannot be said to be "exclusively possessed" by the State itself. Although the State argues that someone must be able to bring this claim, the court does not agree. There is no requirement that every situation fit into the box of ‘trespass.’”).
123 State of New Hampshire v. 3M, No. 216-2019-CV-00445. 15 (N.H. Super. Ct. June 25, 2020). The court also rejected the state’s premise of parens patriae to support its trespass claim, but the analysis was tangled with the court’s finding of factual deficiencies in the complaint. Id. at 17-18.
exclusivity factor altogether.\textsuperscript{126} Similarly, in Rhode Island, a federal court found that a trespass claim could go forward in a MTBE suit because the state was suing in its capacity as \textit{parens patriae} to clean up the pollution.\textsuperscript{127} Another MTBE case filed in 2017 by the State of Maryland against major fossil fuel companies (with no dispositive rulings yet) relied explicitly on the public trust to frame its trespass and other common law tort claims, stating in the complaint, “The state, as the public trustee, is empowered to bring suit to protect the corpus of the trust – \textit{i.e.} the waters – for the beneficiaries of the trust, \textit{i.e.}, the public.” The public trust property interest formed the core of the trespass claim, asserting interference with “the State's possessory interest as the trustee of the State's natural water resources.”\textsuperscript{128} Suffice it to say, the hybrid public trust/trespass claim for natural resource damages remains at a crossroads.

\textsuperscript{126} Department of Environmental Protection v. Deull Fuel, no.aT1-1-1839-18 (N.J. Super. Ct. Law Div. Aug. 8, 2019). Presumably, this decision no longer has controlling force due to the appellate court’s opinion in \textit{Hess}, supra note 124, reaching a contrary result.

\textsuperscript{128} See Pl.'s Compl., Maryland v. Exxon Mobil Corp., No. 1:18-cv-00459, ¶ 350 (D. Md. Dec. 13, 2017); see also id. ¶ 20 (“The state has a . . . natural-resource-trustee interest in protecting the waters of the state from contamination. . . .”).
In summary, the PCB, MTBE, and PFAS cases have met with substantial (though not universal)\textsuperscript{129} success so far, asserting primarily common law claims to achieve a public trust objective. They are the closest analogues to the atmospheric NRD litigation suggested by this chapter, as they seek recovery of damages against manufacturers for cleanup of contaminated public ecological resources. The challenge will be to convince judges and juries to apply the same or similar claims to fund cleanup of the atmosphere. The second-generation climate adaptation cases, though similar in their claims and defendants, are fundamentally different as they have no obvious public trust component;\textsuperscript{130} most remain mired in jurisdictional battles and have not been the subject of dispositive rulings on motions to dismiss.

\section*{E. CAUSATION AND JOINT AND SEVERAL LIABILITY}

Causation forms a standard part of any lawsuit. Notably, the causation hurdle is more straightforward in a suit for atmospheric NRDs than for secondary damages resulting from climate disruption. Courts and commentators have pointed out the difficulty of attributing isolated climate harm—damage from flooding, fires, droughts, and the like—to human-caused emissions, though the science of attribution is rapidly developing and is invoked in the second-generation climate liability cases. A lawsuit for primary damage to the atmosphere (as suggested by this chapter), involves direct causation, because all fossil fuel emissions since the Industrial Revolution theoretically hold potential to raise the concentration of atmospheric CO\textsubscript{2} beyond the natural baseline of 280 ppm (the level prior

\begin{footnotesize}
\begin{itemize}
\item \textsuperscript{129} See, e.g., In re MTBE Prods. Liab. Litig., 2015 WL 4092326, slip op at 4 (S.D. N.Y. July 2, 2015) (dismissing trespass claim for state’s lack of exclusive possession of groundwater and dismissing public nuisance claim because defendants did not own the property from which the nuisance arose, as required for liability under Pennsylvania law).
\item \textsuperscript{130} Though the State of Rhode Island included a stand-alone PTD claim in its complaint, it failed to assert any relief specifically tied to damage of public trust assets.
\end{itemize}
\end{footnotesize}
to the Industrial Revolution), thereby disrupting the balance of Earth’s climate system.\textsuperscript{131}

Two matters remain, however. First, manufacturer-defendants in analogous cases argue that they are not the proximate cause of the harm, because consumers are the actual emitters. Several key cases in all three analogous contexts have soundly rejected this argument. The court in \textit{San Jose v. Monsanto}, applying California law in a PCB case, held that intervening acts by third parties do not break the causal chain where the acts are “reasonably foreseeable, and should have been anticipated.”\textsuperscript{132} It noted, “Here, the Cities allege that Monsanto was aware of the dangers of PCBs, the likelihood of widespread contamination, and the difficulties of disposal and containment—and that, despite those risks, Monsanto continued to promote the sale of PCBs and continued to encourage third parties to use them in their products.”\textsuperscript{133} Similarly, the court in the Oregon PCB case found causation established, noting it was sufficient that plaintiffs alleged, “Defendants knew that the PCBs would inevitably wind up polluting Oregon’s waters through the normal, ordinary use of Defendants’ customers.”\textsuperscript{134} The federal district court in \textit{Seattle v. Monsanto} adopted a similar approach.\textsuperscript{135} An Ohio court found causation could be established by showing Monsanto’s knowledge that high levels of PCBs would inevitably enter Ohio waterways “\textit{notwithstanding} any intervening acts by third parties,” noting, “Monsanto [allegedly] knew that the contaminant \textit{eventually} would enter the waterways by their very nature. Here, since Ohio claims Monsanto did nothing to stop the foreseeable risk, the resulting harm may be causally connected.”\textsuperscript{136} Similar to these

\textsuperscript{131} A significant share of CO\textsubscript{2} emissions remains in the atmosphere for centuries, even though a portion is also relatively quickly absorbed by terrestrial systems and the ocean. See Alan Buis, \textit{The Atmosphere: Getting a Handle on Carbon Dioxide}, NASA (Oct. 9, 2019), https://climate.nasa.gov/news/2915/the-atmosphere-getting-a-handle-on-carbon-dioxide/.

\textsuperscript{132} City of San Jose v. Monsanto Co., 231 F. Supp. 3d 357, 364 (N.D. Cal. 2017).

\textsuperscript{133} Id.

\textsuperscript{134} State v. Monsanto Co., No. 18CV00540, 14 (Or. Cir. Ct. Jan. 9, 2019).

\textsuperscript{135} City of Seattle v. Monsanto Co., 237 F. Supp. 3d 1096, 1107 (W. D. Wash. 2017) (noting Seattle’s allegation that “PCBs foreseeably leached into Seattle’s waterways through the routine use of PCB products”) (emphasis in original).

PCB cases, the Vermont court in the PFAS context found producers liable despite relinquishing control of the product after sale, relying on the Restatement’s position that a defendant may be held liable for harm that continues after that defendant's actions have ceased, and that "substantial participation" in a chain of actions can be sufficient.\(^{137}\) And in the MTBE context, the second circuit affirmed producer liability as well.\(^{138}\)

A second matter arises when there are multiple producers of the harmful substance, as is the case with fossil fuels. The issue becomes whether a court will require plaintiffs to trace CO\(_2\) emissions to particular defendants. Courts are unlikely to require plaintiffs to engage in the impossible task of “fingerprinting” carbon molecules remaining in the atmosphere and tracing them back to particular producers. In the CERCLA context, for example, courts rejected any fingerprinting requirement, opting for a nearly “causation-free” liability scheme.\(^{139}\) The causation hurdle also appears quite low in cases brought against oil companies in both the MTBE and PCB contexts. In\(\textit{In re MTBE Products Liability Litigation}\), the court applied the New York state law test of tort causation, which holds that “an act or omission is regarded as a legal cause of an injury if it was a substantial factor in bringing about the injury,” and found Exxon liable for groundwater contamination based in part on its 25% market share of gasoline.\(^{140}\) A more recent MTBE ruling by federal district judge William Smith reasoned that a conventional causation test would leave the public without recourse. Noting that the task of tracing MTBE molecules to particular defendants “will always be in vain” due to the commercial practice of co-mingling supplies,\(^{141}\) he adopted an expanded approach to

\(^{137}\) Vermont v. 3M Co., No. 2:19-cv-00134, 6 (Vt. Super. Ct. 2020) (citing Restatement (Second) of Torts § 834 and cmts. (1979)).

\(^{138}\) \textit{MTBE Prod. Liab. Litig.}, 725 F.3d 65, 121 (2\textsuperscript{nd} Cir. 2013) (but also relying on Exxon’s involvement in the Queens gasoline market).

causation, noting that other jurisdictions had done the same so as not to leave plaintiffs with an “‘impossible burdens of proof.’”\textsuperscript{142} These MTBE cases offer a close analogue to the proposed ARL as they target the same fossil fuel industry defendants.

Where multiple actors contribute to contamination and the harm is indivisible, courts may impose joint and several liability to hold any one defendant, or subset of defendants, liable for the entire harm (sometimes depending on whether they are responsible for a threshold amount of harm).\textsuperscript{143} The liable defendants may sue the other parties for contribution, but the onus of doing so, along with the litigation costs, falls on the liable defendants rather than the government representing the public. The approach can greatly expedite the process of securing funding for a cleanup, because it saves the government from pursuing litigation against all parties and proving their proportionate share of responsibility. In face of climate urgency, such an approach would be most expedient. Courts have imposed joint and several liability in the CERCLA context,\textsuperscript{144} even in the face of congressional silence on the matter, and several courts in toxic tort litigation have taken the same approach.\textsuperscript{145} But if a defendant can prove a “reasonable basis” for apportioning harm, that defendant’s liability may be limited to the amount of harm attributable to his or her actions.\textsuperscript{146} Applying this rule to the climate context, a court could theoretically find each defendant corporation responsible for the amount of emissions attributable to its fossil fuel production, as detailed in the Carbon Majors report described above.

F. DEFENSES

Industry defendants typically assert many defenses to liability claims. Most are quite case-specific and well beyond the scope of this chapter. Two deserve brief mention here, however, because they are nearly ubiquitous: standing and displacement.

1. STANDING (INCLUDING REDRESSABILITY)

The doctrine of standing requires a litigant to “demonstrate that it has suffered a concrete and particularized injury that is either actual or imminent,” is “fairly traceable to the defendant,” and “it is likely that a favorable decision will redress that injury.”147 Sovereigns bringing ARL suits in the United States must meet these tests. As to the first, sovereigns’ trustee obligations provide government plaintiffs standing to sue for injury to damaged public trust assets;148 the closely related parens patriae doctrine also forms a “mechanism of standing.”149 Sovereigns must educate judges that, with respect to the atmospheric trust, there is no overarching global trustee, but rather multiple co-trustees, connected through a parallel order of trust relationships in which nations and sub-sovereigns share the benefits and obligations relating to the common atmospheric trust. In theory, each sovereign trustee has standing to sue for restoration costs of the shared asset, the atmosphere.

The second component of standing, “fairly traceable to the defendant,” is likely to be addressed as part of the causation element explored above. The third component, redressability, requires judicial understanding of the carbon cycle. In the case of an oil spill or land-based hazardous waste dump cleanup, the remediation is quite obvious to courts. Sovereign trustees

148 Characteristic of language in a complaint is Maryland’s assertion in an MTBE case: “The State, as the public trustee, is empowered to bring suit to protect the corpus of the trust-i.e., the waters-for the beneficiaries of the trust-i.e., the public.” Pl.’s Compl. at ¶ 21, State v. Exxon Mobil Corp., No. 1:18-cv-00459 (D. Md. Dec. 13, 2017); see also Pl.’s Compl. at ¶ 14, Washington v. Monsanto Co., No. 16-2-29592-6 SEA (W. D. Wash. 2017) (“The State has standing to bring this lawsuit as trustee of all aforementioned public natural resources.”).
remove the contamination from the site in a direct and easily observable manner. Sky cleanup of carbon dioxide is less obvious. The natural climate solutions (NCS) projects that scrub the atmosphere of CO₂ and sequester carbon in the soil are the only currently feasible projects to accomplish a sky cleanup. The importance of a scientifically-produced Atmospheric Recovery Plan cannot be overestimated, because it serves as the framework providing evidence of redressability, making clear the connection between soils, plants, and drawdown (cleanup) of atmospheric carbon pollution. Courts that are able to comprehend the carbon cycle may find this general aspect of redressability satisfied.

Beyond this, there remains the matter of proportionate contribution to a global sky cleanup. In cases seeking to abate carbon pollution, government or industry defendants often make the claim that climate crisis is a global phenomenon, and that a court order requiring action on the part of one nation, or one state, will not solve the problem -- thus coming up short on redressability. This argument was rejected in Massachusetts v. EPA, where the U.S. Supreme Court stated that the Bush II Administration defendants propounded “the erroneous assumption that a small incremental step, because it is incremental, can never be attacked in a federal judicial forum. Yet accepting that premise would doom most challenges to regulatory action.”¹⁵⁰ Increasingly, courts hold individual sovereigns accountable for the pollution coming from their jurisdiction. In the Netherlands, the Supreme Court rejected the government’s argument that the nation’s emissions were so small as to be non-redressable, stating, “Acceptance of these defenses would lead to a country simply being able to escape its partial responsibility by pointing to other countries or to its small share.”¹⁵¹

¹⁵⁰ Massachusetts, 549 U.S. at 524.
¹⁵¹ Netherlands ATL, supra note 28, at ¶ 5.7.7.
The redressability argument, of course, takes a slightly different twist in ARL cases as distinguished from ATL cases. In the latter, government defendants emphasize the small proportionate share of emissions. In ARL, the argument focuses on cleanup. It is certainly true that all jurisdictions can only accomplish a fractional share of atmospheric cleanup. But by the same token, the global effort requires all situated jurisdictions (those with land sequestration potential) to participate. Environmental law already has the tools for a multi-jurisdictional approach to liability and restoration. In the context of species recovery, it is often the case that, because no one sovereign can recover the species, full recovery requires cross-participation by multiple sovereigns. The same is true with an oil spill that migrates between jurisdictional borders. In the atmospheric cleanup context, the contribution of any one region will be limited – yet each is instrumental to full drawdown of excess atmospheric carbon. Judges understanding the realities of climate science should eschew rigid approaches but rather interpret the redressability requirement within the constraints that nature’s laws impose on human society. Failure to hold responsible corporations financially liable for atmospheric cleanup perpetuates a status quo that rapidly veers towards a scenario of uncontrollable planetary heating.

2. DISPLACEMENT

A second defense perpetually raised by defendants in climate cases is that of displacement, which asserts that a statute (typically the Clean Air Act) has “displaced” common law, rendering the latter ineffectual as a basis for a claim. In the leading American Electric Power case, the U.S. Supreme Court found that the Clean Air Act, which authorized the U.S. Environmental Protection Agency (EPA) to regulate CO$_2$ emissions, displaced a suit asserting common law nuisance claims against major CO$_2$ emitters despite the fact that
EPA had not actually regulated the CO₂ emissions. Several climate cases, including some of the second-generation nuisance cases described above, have fallen into the displacement trap, and several appeals are pending. As Professor Katrina Kuh observes, dismissals on the basis of displacement represent fundamental “judicial climate avoidance.”

Notably, however, the AEP decision did not suggest that displacement could extend to another, entirely separate, cause of action. Sovereigns seeking damages for cleanup of the atmosphere should distinguish NRD claims from the common law climate nuisance claims that have encountered obstacles, for the two stand in stark contrast. The interests of future generations – forming the core of a public trust action -- are never captured in a nuisance test, which focuses on present interference with a particular right held by the citizens. More fundamental, the public trust represents a sovereign obligation that cannot be displaced by statute. As the Juliana court observed,

> In AEP, the Court did not have public trust claims before it and so it had no cause to consider the differences between public trust claims and other types of claims. Public trust claims are unique because they concern inherent attributes of sovereignty. The public trust imposes on the government an obligation to protect the res of the trust. A defining feature of that obligation is that it cannot be legislated away. Because of the nature of public trust claims, a displacement analysis simply does not apply.

**G. THE REMEDY AND IMPORTANCE OF A REGIONAL PLAN**

The backdrop to any atmospheric NRD lawsuit should be a regional plan setting forth a framework from which to organize drawdown projects. Such a plan is essential to bring the sky cleanup effort to a tangible level that courts will understand. This framework provides a remedy

---

153 Kuh, supra note 1, at 4.
154 Juliana v. United States, 217 F. Supp. 3d 1224, 1260 (D. Or. 2016); contra Alec L. v. Jackson, 863 F. Supp. 2d 11 (D. D.C. 2012) (adopting displacement theory to dismiss ATL claim). Another related defense, beyond the scope of this chapter, is the “political question” defense, which limits courts from hearing issues that are fundamentally committed to the political branches of government.
structure that courts can fund through atmospheric NRD awards. Scientists and professionals are positioned to design a plan that matches the sequestration capacity of a region with the resources, needs, and incentives of the local communities undertaking restoration.\textsuperscript{155} It must clearly explain the Earth’s carbon cycle, identify the “engines” of sky cleanup as land-based methods, and delineate the restoration potential of the particular sovereign(s) suing for natural resource damages.

Beyond such a plan, the remedy stage of atmospheric recovery litigation requires designating a fund to receive the damages and finance the drawdown projects. This requires an administrative structure to solicit projects, evaluate proposals, administer the funding, and supervise the completion of work. Sovereign plaintiffs (even prior to the litigation) may establish a “Sky Trust” for this purpose, in which case the court’s role is simply to approve such trust as a recipient of the funds. Alternatively, the court may set up its own judicial trust, either through settlement processes or through direct order. Three prominent models illuminate possibilities.

\textit{VW Settlement} – In litigation brought by U.S. Department of Justice against Volkswagen (VW) for installing defective pollution control equipment in its automobiles,\textsuperscript{156} the court approved a settlement creating an Environmental Mitigation Trust Fund to mitigate millions of tons of NOx pollution that had been emitted into the nation’s airshed. A $2.9 billion fund financed by VW and administered by a court-appointed trustee allocated money to States and Indian Tribe “beneficiary funds” based on the number of illegal vehicles sold in their jurisdictions. The sovereign

\textsuperscript{156} See \textit{Volkswagen Clean Air Act Civil Settlement}, EPA, https://www.epa.gov/enforcement/volkswagen-clean-air-act-civil-settlement.
beneficiaries developed plans, subject to trustee approval, to reduce NOx pollution in their jurisdictions, and their agencies supervised the projects.

**BP Settlement** - In litigation by the U.S. Department of Justice against BP for discharging millions of barrels of oil into the Gulf of Mexico (after a drilling rig exploded in 2010), BP agreed to pay $7.1 billion to the Deepwater Horizon Oil Spill NRD Fund, managed by the Department of Interior, for the joint benefit of the five Gulf state trustees. The Fund distributes money to projects aimed towards cleanup and ecosystem recovery across an area larger than the state of Idaho.

**California Lead Abatement** - In litigation brought by the state of California and several counties against three major lead paint manufacturers, a 2014 trial court judgment found the companies liable for the cost of removing lead paint in over 3.5 million residences. A $305 million settlement funds a court-ordered lead abatement program administered by the state of California and the counties over a four-year period.

All three instances above involve massive funds and multi-stage implementation aimed towards remediating contamination. While each required some amount of judicial supervision and ongoing jurisdiction, the primary administrative apparatus relied on sovereigns or an independent court-appointed trustee to administer the funds. In the atmospheric recovery context, courts can similarly set up funds administered by sovereign plaintiffs and/or appoint a trustee to finance sequestration projects to clean up the contaminated atmosphere.

**CONCLUSION**

---

159 Remedies in NRD actions are often the subject of settlement negotiations and consent decrees. Cases make clear “trustees can settle suits with far less than a full damages picture.” N.J. v. Exxon, 183 A.3d 289, 318 (Sup. Ct. N. J. 2015).
The narrow window of time to prevent uncontrollable planetary heating is closing rapidly, and for the law is to be constructive, it must address both sides of the climate imperative – decarbonization and drawdown of massive amounts of CO₂. Atmospheric Trust Litigation is underway to force the first, and the Atmospheric Recovery Litigation described in this chapter aims to spur the latter. ARL envisions natural resource damages suits brought by sovereign trustees – states, tribes, counties, and foreign nations – against fossil fuel carbon majors to fund landscape carbon sequestration projects in their jurisdictions. Based on the model of cleaning up an oil spill, such a litigation strategy is likely anticipated by the fossil fuel corporations themselves. As industry lawyer Ira Gottlieb acknowledged in 2008, “[I]t may only be a matter of time before natural resource trustees file actions for NRD[s] based on climate change effects.”

The approach developed in this chapter lends itself to various scales of litigation. The public trust principle exists not only in every state, but on the federal level (assuming Juliana’s recognition of the federal trust is upheld) and in many other nations as well, presenting potential litigation on both national and sub-sovereign levels in various parts of the globe. On one end of the spectrum, a consortium of states could bring a massive nationwide suit to force funding of restoration across the United States (capitalizing on perhaps 20% of the global potential). On the other end of the spectrum, an ARL effort (not unlike the ATL campaign) could proliferate through multiple parallel suits at the state level and in domestic courts of other nations. Such suits could be brought simultaneously in various jurisdictions, modeled on a shared framework but adapted to unique legal requirements of the various jurisdictions. Sovereign co-trustees may bring new lawsuits, or they may intervene in existing climate damages suits, pressing public trust claims

161 See Pakistan ATL, supra note 28; Amazon ATL, supra note 28; Netherlands ATL, supra note 28.
162 Robertson, supra note 2, at 29.
that fund carbon sequestration (rather than local adaptation measures currently sought by climate plaintiffs). It may be that the global leaders best positioned to pull legal systems towards atmospheric drawdown are in those nations that do not contribute much in terms of proportionate emissions, but hold tremendous capacity for sequestration – such as South American countries in the Amazon Region, or Indonesia, or the drowning island nations, for example.

Any litigation strategy should proceed in sync with the other components of atmospheric recovery. Sovereign leaders should waste no time initiating plans for tapping and maximizing their sequestration potential across landscapes, enlisting scientists to identify spatially explicit opportunities and create tangible guidelines for projects. They should also begin devising Sky Trust institutions for administering drawdown projects across their jurisdictions. To bring the atmospheric recovery challenge to the necessary scale, sovereigns should collaborate and unify into coalitions spanning shared ecosystems.

In order for atmospheric NRD litigation to succeed, judges must embrace a role that might be thought of as global rescue. If there is one major lesson from the U.S. climate litigation so far, it is that American courts have positioned themselves as wallflowers in this intensifying climate emergency, even though they constitute a third branch of government with tremendous – and singular -- power to force the other branches to de-escalate the perilous fossil fuel energy policy positioned to push the world over the edge of a looming climate cliff. The passivity of U.S. courts is perhaps no more dramatically exemplified than by the opinion of two judges forming a majority of the Ninth Circuit in *Juliana v. United States*, acknowledging in the most explicit terms that climate destabilization could bring about the end the nation, yet refusing to entertain any possible configuration of a judicial remedy. At this eleventh hour, judicial intervention
may be the only recourse to break a political stalemate threatening life, liberty, and civilization itself.

For U.S. climate litigation to succeed, judges must be willing to craft remedies that protect the rights of young people to a stable climate system. Looking to other established areas of civil rights litigation, judges can readily find tools and precedent, but they must be willing to engage that work. Courts from other nations are leading the way in what could be a pan-global jurisprudential movement, creating climate commissions, requiring climate plans, and holding their governments to quantitative standards.\textsuperscript{163} In this tenuous and epic moment – in which a remaining opportunity to stave off irrevocable tipping points seemingly exists only due to economic collapse resulting from a global pandemic -- courts have a fleeting chance to meaningfully act before nature’s own laws moot a governmental role altogether. Judicial leadership, profound professional courage, and a stirring sense of duty may well carry more consequence at this moment than the black letter law, for there is no precedent for our situation. It would be a mistake to overlook those few luminaries on the bench who have written pathbreaking opinions in which they deem it the constitutional duty of courts to provide a remedy for violations of fundamental rights.\textsuperscript{164} These judges, by carefully asserting legal obligations well-grounded in history and calling their colleagues to a constitutional high ground, might still persuade their colleagues on the bench to hold government accountable. Hawaii Supreme Court Associate Justice Michael Wilson writes, "As the archetypal peril of earth with collapsing ecosystems approaches, legal narratives limiting judicial review [of] carbon-caused global warming will become anachronisms."\textsuperscript{165}
